

Ioan Miclău:

AMONG DINOSAURS

The story which I am about to tell, is not direct a scientific demonstration, but it is instead a reality which I observed, reading some scientific material. It is about the time and existence of dinosaurs, their way of life, behaviour, and instantly disappearance, a.s.o! Anyway, I pay a great respect for archaeologists, for paleon-biologists, for scholars, eventual, just from their's fine works, and their 'friendly' controversy sometimes. I attained some inspirations for what I have to talk about.

Therefore, I will begin with a world wide well know story about the grandfather, who was desperately looking to find his glasses. He checked all around for it. Pulled threw the pillows off the bed, looked under the bed, opened all the drawers in house, but there were no glasses. He decided eventual to go outside and dig amongst the flowers in his backyard. But on his way, he looked into a mirror which was hung on the wall, and saw the glasses on his nose. "Fantastic! he said, they are with me. What I am crushing my self to find them, if they are with me? The grandfather simple picked up his glasses, and looked fraternally to it, and said: "You are useful to me".

Now, it is said that about 65 million year ago, the dinosaurs vanished completely from our planet, but now again is it also said, as recognised by all scholars, that the dinosaurs are still among us and they are extremely useful for in life.

Following the scientific point of view, I discovered a variety of dinosaurs directly in my backyard. They were there for long time, but I did not realise the dinosaurs were actually the birds I kept; namely pigeons, chickens, peacocks, pheasants.

Firstly, if my dear reader, should walk on my street in the morning, passing at the front of my house, they will discover what I am describing. Secondly, the noises heard, the different tune of their songs, I assure you, that it is like a real 'Jurassic Park' in this area. Overall, the barking from many dog's ancestors will be heard barking, existing, of course, in every backyard. Now, with my peacock-dinosaur, hen-dinosaur, pheasant-dinosaur, pigeon-dinosaur, all alive, what is the need to rummage more the land?

I recognize that the fossils and bones discovered, reconstituted and compared with today's fauna was an excellent idea, a good beginning step. I heard then and about some verification done by paleo-anthropologists on some dinosaur's footprints which appeared to be similar with the footprints of a turkey living in our times. To be sure of that, the scholars took from a farm a turkey alive, and the footprints compared were perfect identical. That discovery left me not in a big confusion, but only made me to assert a logical idea, that being identical the footprints of two dinosaurs living at so long intervals, 65 million years, there is not place for some evolutionary theory.

I heard that some scholars doubts about '*carbon 14*' method, it is not working properly showing the age of an archaeological fossil. If it is the case, there is not without meanings to have some thousand million years more or less, added to reality. In abundance food for herbivorous surely made possible to develop their bodies in big sizes, but the natural patent of their's bony system and joints is there, as today, and it is important.

The birds are again a variety of dinosaurs, so fetching a peacock and some hens, cleaning off their feathers, there is a really variety of them. As a superior being the man, who eat everything, will have and some meat for BBQ, and dinosaur's bone-fossil to study. Now, there are not needs to find out anything about their behaviour and walk, because they are alive and under our control.

What we must to observe in general at dinosaurs, is that they have some sense of morale, as a natural traits. Then, the nostrils position on the nose, in front or over, again is a reason for which the scholars are arguing passionately. Anyway, some vertebrates lost in the time their tails, and, it doesn't happen for biocratism, sitting the gorila on a stone chair too long, looking around. Even the mutation idea, is not an efect without to be premeditated by a cause, and everything which appears is a subject of time and space and bio-system's universal chance.
